Market Structure & Product Differentiation

THE CORE IDEA

Monopolistic competition combines many sellers and relatively easy entry with differentiated products. Differentiation gives each firm a downward-sloping demand curve and some pricing discretion. Close substitutes limit that discretion; entry can eliminate economic profit in the long run.

HOW TO RECOGNIZE IT

- A market has many sellers and easy entry.
- A dental practice competes mainly through evening hours, online scheduling, and unusually fast appointments.
- A restaurant has many nearby rivals, but customers value its menu and atmosphere enough that a small price increase does not drive everyone away.
- A market has many small sellers and easy entry, but every seller offers exactly the same product.
- A neighborhood café competes through atmosphere, menu, and location.

WATCH OUT

Differentiation explains why an individual firm faces downward-sloping demand despite many sellers and easy entry.

WORKED EXAMPLE: IDENTIFYING PRODUCT DIFFERENTIATION

A city has many coffee shops, entry is relatively easy, and each shop offers a distinct menu and atmosphere. Because customers view the shops as close but imperfect substitutes, each shop faces downward-sloping demand and has limited price-setting power. Those facts identify monopolistic competition.

CHECK YOURSELF

Why is a differentiated firm's demand downward sloping?
